

Weatherproof control unit for NIROS TRX3001 mobile radio

In order to handle the pressure equalisation and to provide venting of the unit to avoid build up of moisture due to condensation the control unit is equipped with a GoreTex® valve.

The control unit is designed for use on motorcycles, motor scooters, boats, trucks etc. The control unit can even be used stationary, where NIROS TRX3001 is used as a base station.

Mounting of the unit is easily carried out with the four threaded holes on the rear of the unit or with the two threaded holes on the side of the unit.

The weatherproof control unit for NIROS TRX3001 is developed to stand up to extreme environments, where humidity, dirt, cold or vibrations occur.

In order to withstand these external environmental influences the control unit is built up around a homogenic aluminium housing. Furthermore a vacuum-formed foil is designed to protect the keypads against humidity or dirt. At temperatures below zero the built-in heating of the display will start automatically in order to secure a quick show of the information
